Optimizing CMN collection for ECP With OPTIA device by filling one single chamber

- Rational of the study
  - Large variability of CMN collected
    - Many patient had few CMN collected
    - Specialy those with immunosupressive therapy (cortison with low level of CMN in the blood
    - CMN collected depending of CMN in the blood
  - No target for amount of CMN or lymphocyte
  - What is the current procedure.
    - To process 1 or 2 total blood volume wirh cells separator
    - Therakos 1.5 liter processed

- Aim of this study
  - BAsed on the fact that we don't know if total amount of CMN have an impact of therapy,
  - Not to collectec as much we can
  - But to Standardize CMN amount for each ECP session
    - All patient on the same level regarding on CMN collection
    - For those patient to hom we collete few CMN cells
    - Easy to make any retrospectiv analysis on clinical ECP clinical effect, having one less variablity data.

Our experience on CMN collection in our unit over more than 1800 ECP session

1/ Wide experience on device used

Sterile connection done before CMN collection

Cobe Spectra

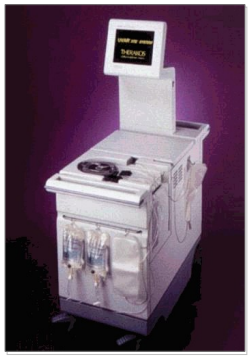
OPTIA

Amicus

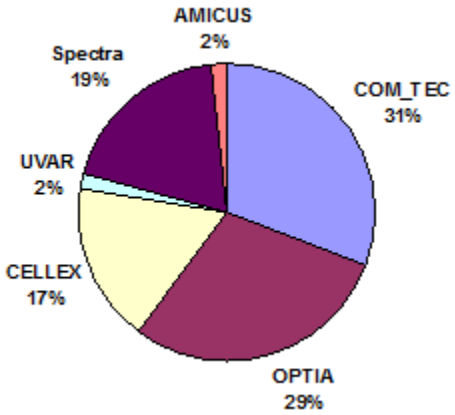
COMTEC

UVA PIT
System

Thérakos CellEx



UVAR XTS



2/ Exhautive quality control on CMN

- CBC ans differential
  - IN the blood before ECP
  - In collection bag
- Real time integrated in Aphéresis database

NaCl 0,9
CHU B 2014 00 154
optia

UVA PIT

1/ Large variablity of CMN collected

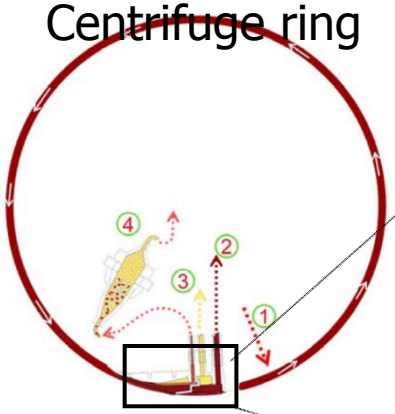
2/ CMN collected depending of CMN in the blood

How to reach the goal of the study

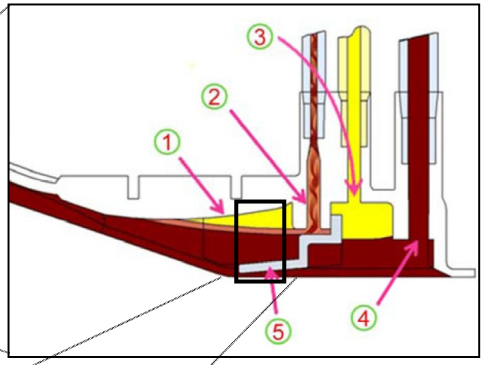
- Looking for technique:
  - Easy , repeatable
  - Fully automated (reduce human variability)
  - By using OPTIA Device we can reach this target

Why using OPTIA with one chamber

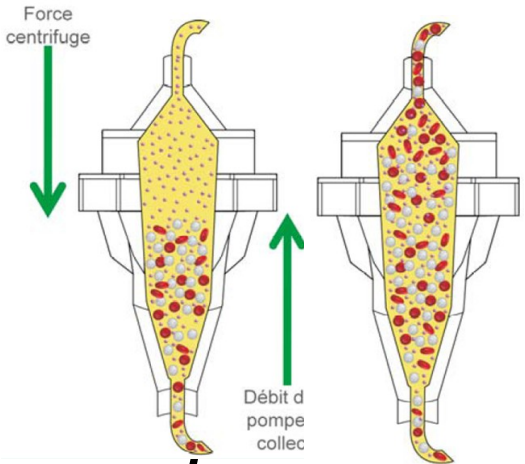
Centrifuge ring

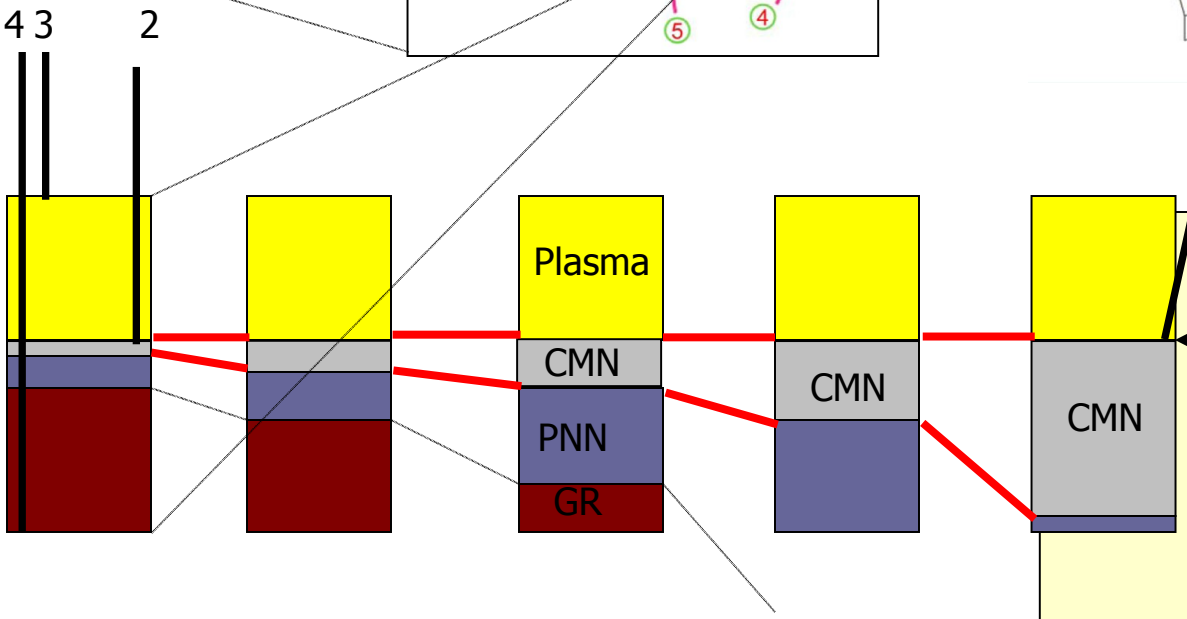


Continusly Collection chambre

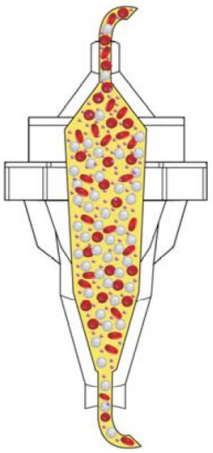


Chambre de collecte





Quality of cells trapped in chamber



- WBC in chanber:
  - CMN: Average is 91%
  - Mediane: 98%
- Almost all WBC in the chamber are CMN
- When a chamber is filled
  - Should we have always the same amout of cells?

Study parameter

- 1 single chamber setting
  - Set UP One single chamber in the software of OPTIA
  - 40 ml in total in the bag
    - 16 ml as collected chamber volume
    - 24 ml to rince the tubing so that we get enought volume for processing into PIT systeme
- From 01/2013 to 04/2014
  - 146 ECP Sessions
  - 102 complete for analysis
- Comparison:
  - 202 ECP done by Optia
    - TBV between 0.9 and 1.1 processed
- Data to be compared
  - CMN, Lymp, Mono
    - Variability
  - Duration, Total blood volume preocessed,

Results: Regarding Total CMN collection

- Regarding to variability
  - Reducing by fliilong on single chamber
- Regarding to total cell collected
  - Effective

Intra individual variation

- Analysis for intraindividual patient variability
  - Each point is patient
  - Sorted by number of procedure
  - Analysis for total CMN collection
- By filling 1 single chamber
  - Reduce intraindividual variation
  - Variablilty is more predictible

Analysis of the amont of total patient blood volume processed

Duration of CMN collection

Conclusion

- Filling 1 single chamber as target
  - Is effective way according to standardize CMN collection
  - Easy to manage (always he same volume collected)
  - Good for schudel managment shorter and predictible
  - Getting enough cells
- To collect more CMN cells
  - To maintain the advantages of chamber target.
  - We can increase the target to 2 chambers
  - Knowing that the second chamber is fullfil faster than the first
- This is intermediate analysis
  - We have to check the impact of
    - Platlette, REd cells, individual
  - Waiting for technical analysis from terumo
    - Each session data was send to terumo R&D to chek if there was any technical failure during collection to make this data more reliable
