Lipoprotéine (a) et Athérosclérose

Professeur Jean Ferrières

Fédération de Cardiologie et Equipe ARTERRE

INSERM UMR 1295

CHU de Toulouse

Patient en vacances à Bayonne qui après une séance de footing présenté des douleurs thoraciques avec une perte de connaissance accompagnée de convulsions suivies d'un arrêt cardiaque.
Réanimé par son épouse médecin urgentiste avec un low flow pendant 20 minutes.
À l'arrivée du SMUR il bénéficie d'un choc électrique externe avec retour en rythme sinusal et un ECG qui s'inscrit un sous décalage diffus avec un sus-décalage en aVR.
Il est conduit au service de cardiologie de Bayonne où il

bénéficie d'une angiocoronarographie retrouvant une occlusion de l'IVA proximale, une lésion intermédiaire de l'IVA moyenne, une occlusion aiguë de l'IVA distale.
Il a été revascularisé ad hoc sur l'IVA avec mise en place d'un stent.
Pic de troponine à 14 000.
L'échographie de contrôle réalisée à J2 montre une FEVG des 35 à 40 % avec une hypokinésie franche en antérieur et en apical ainsi qu'une hypokinésie de la paroi inféro-septale.
Il a été mis sous traitement de l'insuffisance cardiaque et il a bénéficié d'une LifeVest.
Le patient est par la suite transféré au CHU de RANGUEIL pour la suite de la prise en charge.

Votre patient, **Monsieur** **âgé de 40 ans,** (22/06/1983), a été hospitalisé au sein du Département de Cardiologie Interventionnelle et Structurelle du CHU RANGUEIL, Unité 61 du 03/08/2023 au 07/08/2023 **pour suite de prise en charge d'un ST+ antérieur compliqué d'un ACR**

Le patient n'avait auparavant pas de suivi cardiologique habituel.

Aucun antécédent
- pas d'allergie connue.

Ses facteurs de risque cardio-vasculaire associent outre son sexe :
- Hérédité cardiovasculaire

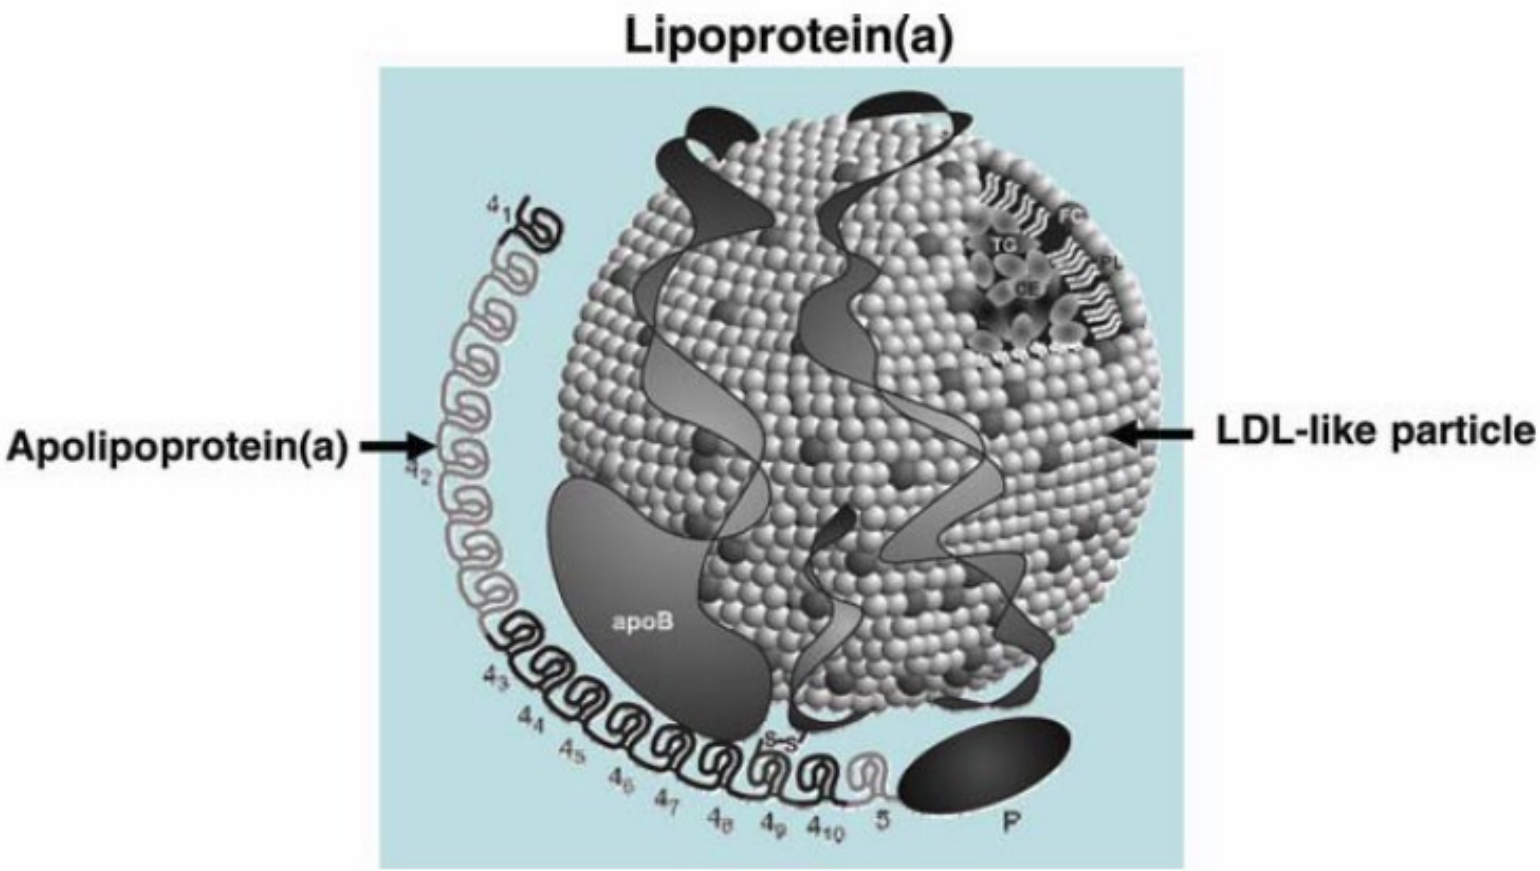
La Lipoprotéine (a)

Lipoprotein(a) as a cardiovascular risk factor: current status

Lipoprotein(a) consists of an LDL-like particle to which apolipoprotein(a) is covalently linked



The LDL-like moiety is composed of a central core of cholesteryl esters (CE) and triglycerides (TG) surrounded by phospholipids (PL), free cholesterol (FC), and a single molecule of apolipoprotein B (apoB). Apolipoprotein(a) contains 10 different types of plasminogen kringle 4-like repeats as well as regions homologous to the kringle 5 and protease (P) regions of plasminogen. The kringle 4 type 2 domain (4_2) is present in multiply repeated copies from 2 to >40 that differ in number between apolipoprotein(a) isoforms. Apolipoprotein(a) is linked to apolipoprotein B100 by a single disulfide bond involving an unpaired cysteine residue in kringle 4 type 9. Modified from Koschinsky and Marcovina.

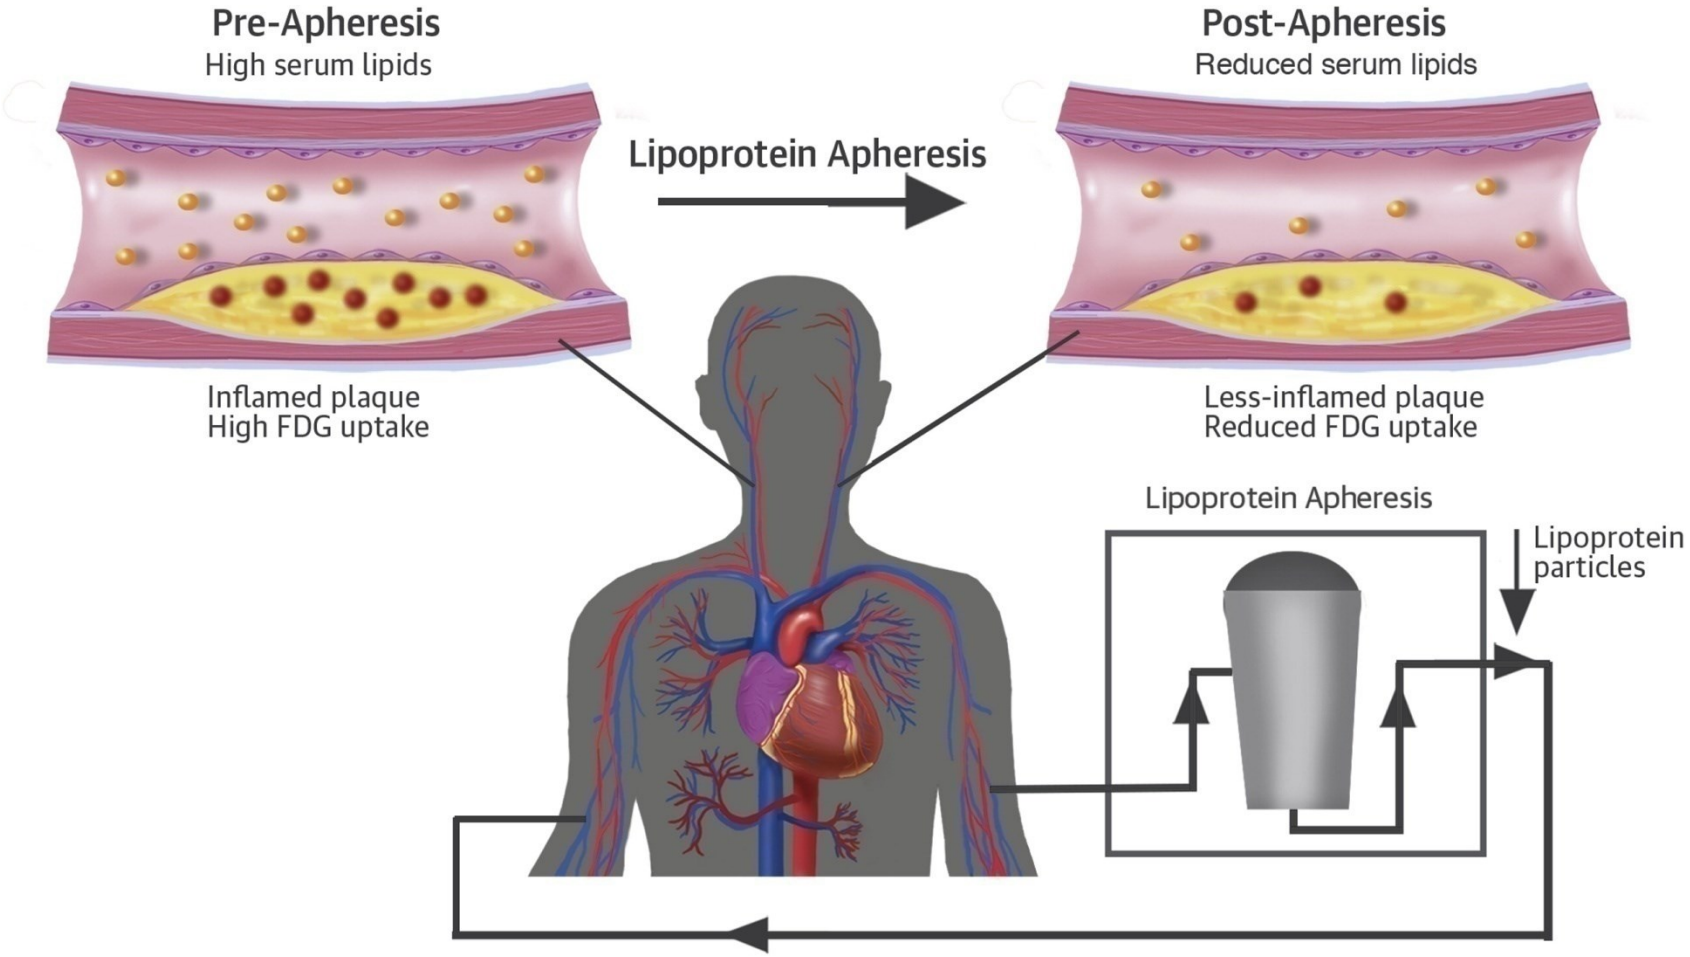
Impact of Apheresis on Circulating Lipids and Atherosclerotic Inflammation



Familial hypercholesterolemia (FH) is associated with elevated circulating lipids and increased atherosclerotic inflammation. Lipoprotein apheresis in individuals with FH results in a rapid reduction in circulating lipids as well as in a concordant reduction in atherosclerotic inflammation, measured as a decrease in arterial fluorodeoxyglucose uptake.

Apheresis as novel treatment for refractory angina with raised lipoprotein(a): a randomized controlled cross-over trial

To determine the clinical impact of lipoprotein apheresis in patients with refractory angina and raised lipoprotein(a) > 500 mg/L on the primary end point of quantitative myocardial perfusion, as well as secondary end points including atheroma burden, exercise capacity, symptoms, and quality of life.

We conducted a single-blinded randomized controlled trial in 20 patients with refractory angina and raised lipoprotein(a) > 500 mg/L, with 3 months of blinded weekly lipoprotein apheresis or sham, followed by crossover. The primary endpoint was change in quantitative myocardial perfusion reserve (MPR) assessed by cardiovascular magnetic resonance. Secondary endpoints included measures of atheroma burden, exercise capacity, symptoms and quality of life.

The primary endpoint, namely MPR, increased following apheresis (0.47; 95% CI 0.31–0.63) compared with sham (-0.16; 95% CI - 0.33–0.02) yielding a net treatment increase of 0.63 (95% CI 0.37–0.89; $P < 0.001$ between groups). Improvements with apheresis compared with sham also occurred in atherosclerotic burden as assessed by total carotid wall volume ($P < 0.001$), exercise capacity by the 6 min walk test ($P = 0.001$), 4 of 5 domains of the Seattle angina questionnaire (all $P < 0.02$) and quality of life physical component summary by the short form 36 survey ($P = 0.001$).

Lipoprotein apheresis may represent an effective novel treatment for patients with refractory angina and raised lipoprotein(a) improving myocardial perfusion, atheroma burden, exercise capacity and symptoms.

European Heart Journal (2017) **38**, 1561–1569
doi:10.1093/eurheartj/ehx178

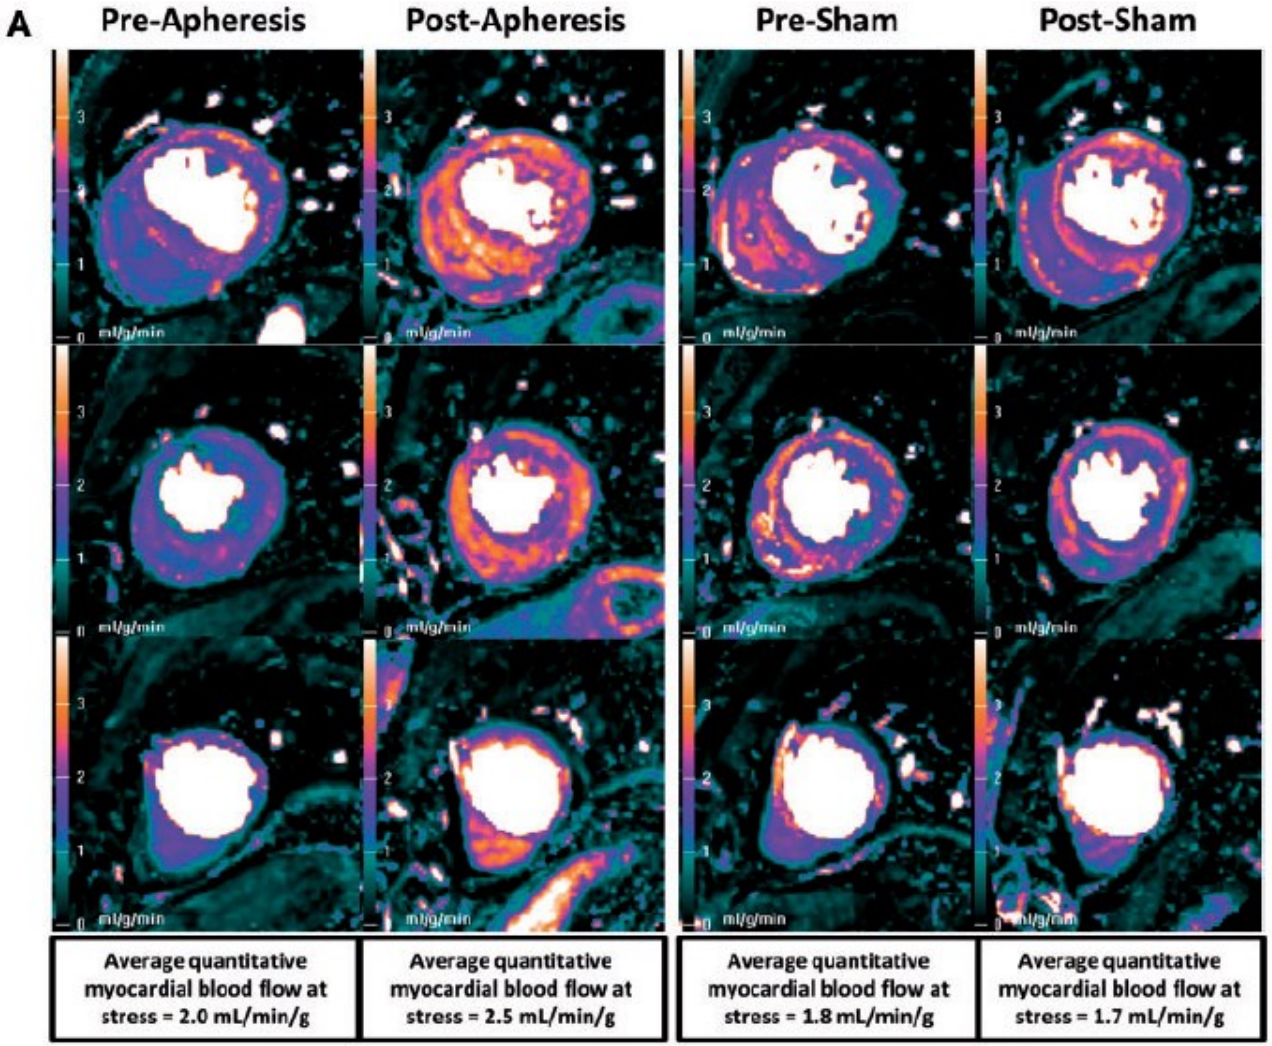

Figure 2 Quantitative CMR perfusion pixel maps pre and post apheresis and pre and post sham (*A*) and group data from myocardial perfusion at rest (left), perfusion with stress (middle) and the myocardial perfusion reserve (right) (*B*). (*A*) Quantitative CMR perfusion pixel maps pre- and post-apheresis and pre- and post-sham. The colour scale shows perfusion from 0–4 mL/g/min as low (black-green), medium (mauve-pink) and high (orange-white), therefore brighter colours represent greater perfusion. In this single patient example, there is clear improvement in stress perfusion after apheresis compared with baseline, but no change is seen during sham treatment. (*B*) Group data are shown from myocardial perfusion at rest

JAMA Cardiology | Brief Report

Estimation of the Required Lipoprotein(a)-Lowering Therapeutic Effect Size for Reduction in Coronary Heart Disease Outcomes

A Mendelian Randomization Analysis

Claudia Lamina, PhD; Florian Kronenberg, MD; for the Lp(a)-GWAS-Consortium

CONCLUSIONS AND RELEVANCE This mendelian randomization analysis estimated a required Lp(a)-lowering effect size of 65.7 mg/dL to reach the same effect as a 38.67-mg/dL lowering

Agent	Effect on Lp(a)	Clinical benefit by Lp(a) lowering	Evidence
Statin	+0.1%, −24%	None	Meta-analysis *de Boer et al.* [19]
Ezetimibe/fibrates	−7.06%	None	Meta-analysis Awad *et al.* [26]
Bempedoic Acid	+2.4%	None	Secondary analysis of RCT trials *Ridker et al.* [27]
PCSK9 inhibitors	−23%, −27%	Approximately 25% of the cardiovascular benefit of PCSK9i is attributable to Lp(a) lowering when initial levels are high.	Secondary analysis of RCT trials *Bittner et al.* [29] *O'Donoghue et al.* [30]

A NEW SERUM TYPE SYSTEM IN MAN—THE Lp SYSTEM

By

KÅRE BERG

Received 25.iii.63

The hypothesis for the study was that animals, when given relatively large doses of an isolated protein from one single donor, might be able to develop antibodies against several antigenic groups on this protein, including possible type-specific factors, and that antibodies against all but the latter could be removed by proper absorptions.

The purpose of the present article is to describe a procedure by means of which a specific antibody was produced in rabbits. This antibody
